Heuristic Evaluation

by Zunaid Ahmed

Heuristic Evaluation

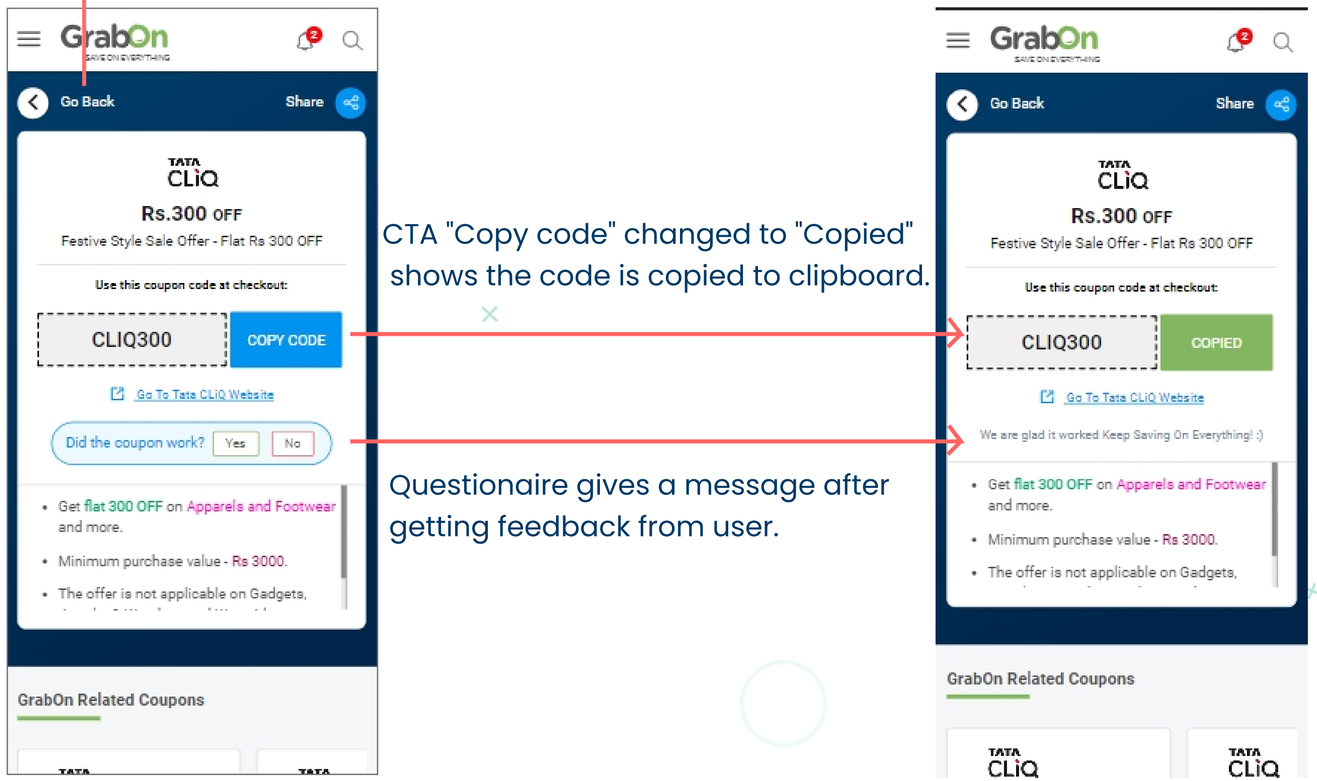

Heuristic evaluation is a process where experts use rules of thumb to measure the usability of user interfaces in independent walkthroughs and report issues. Evaluators use established heuristics (e.g., Nielsen-Molich’s) and reveal insights that can help design teams enhance product usability from early in development.

Nielsen's Heuristics for Usability

- Visibility of system status
- Match between system and the real world
- User control and freedom
- Consistency and standards
- Error prevention
- Recognition rather than recall
- Flexibility and efficiency of use
- Aesthetic and minimalist design
- Help users recognize, diagnose, and recover from errors
- Help and documentation

Visibility of system status

The design should always keep users informed about what is going on, through appropriate feedback within a reasonable amount of time.

Back page direction available

CTA "Copy code" changed to "Copied" shows the code is copied to clipboard.

Questionaire gives a message after getting feedback from user.

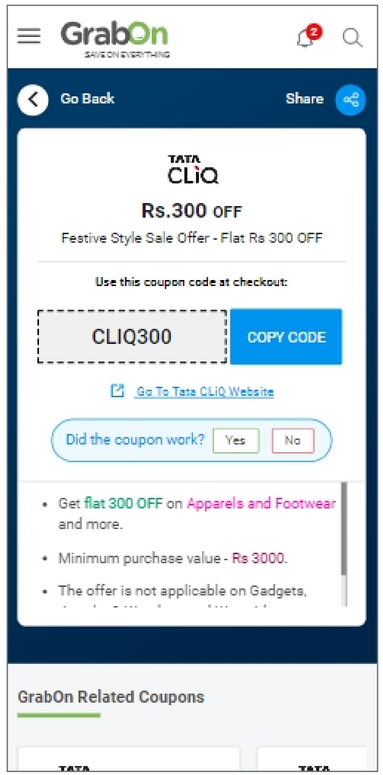

Bad

Average

Good

Match between system and the real world

The design should speak the users' language. Use words, phrases, and concepts familiar to the user, rather than internal jargon. Follow real-world conventions, making information appear in a natural and logical order.

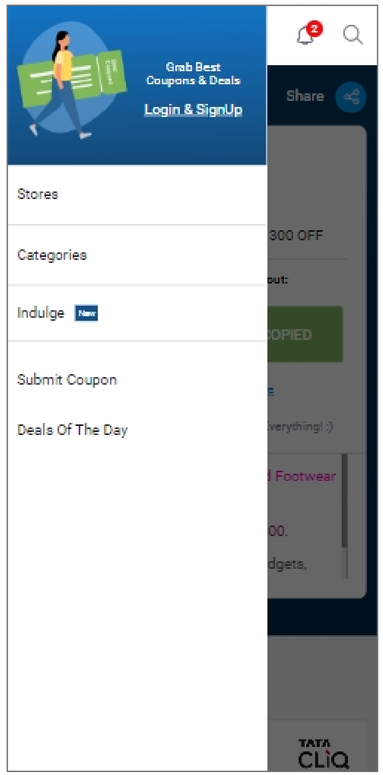

Icons and words are easily recognisable

Bad Average Good

User control and freedom

Users often perform actions by mistake. They need a clearly marked "emergency exit" to leave the unwanted action without having to go through an extended process.

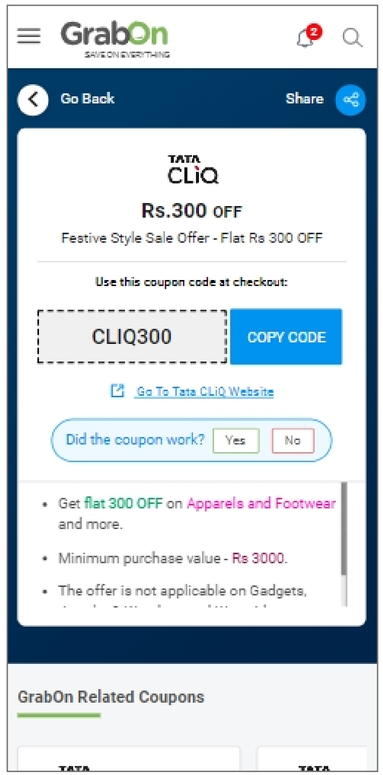

Hamburger menu doesn't have any back button.

Bad Average Good

Consistency and standards

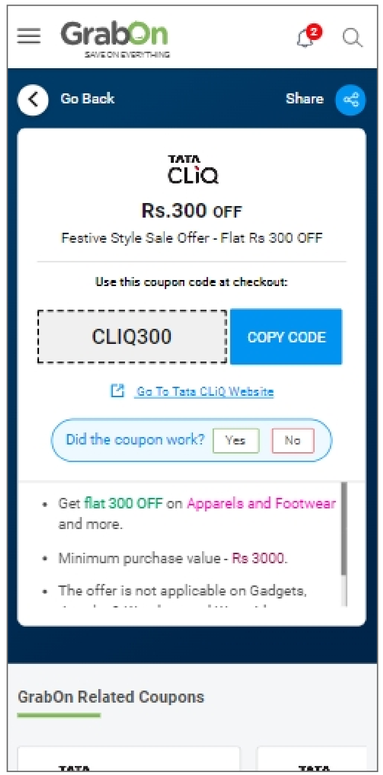

Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform and industry conventions.

Need more user flows to understand consistency across app.

Error prevention

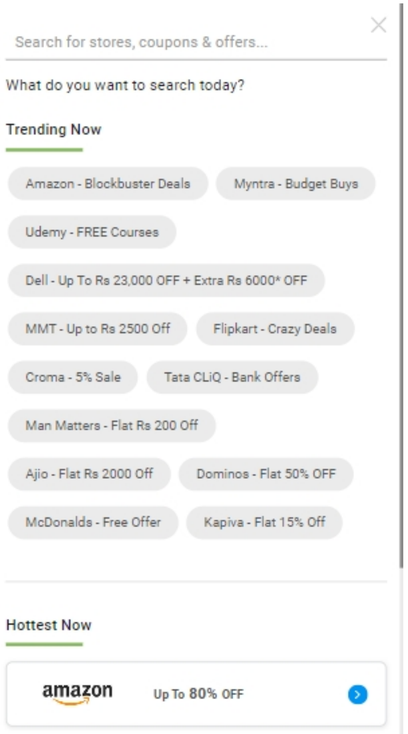

Good error messages are important, but the best designs carefully prevent problems from occurring in the first place. Either eliminate error-prone conditions, or check for them and present users with a confirmation option before they commit to the action.

Didn't find any error-prone condition here.

Recognition rather than recall

Minimize the user's memory load by making elements, actions, and options visible. The user should not have to remember information from one part of the interface to another. Information required to use the design (e.g. field labels or menu items) should be visible or easily retrievable when needed.

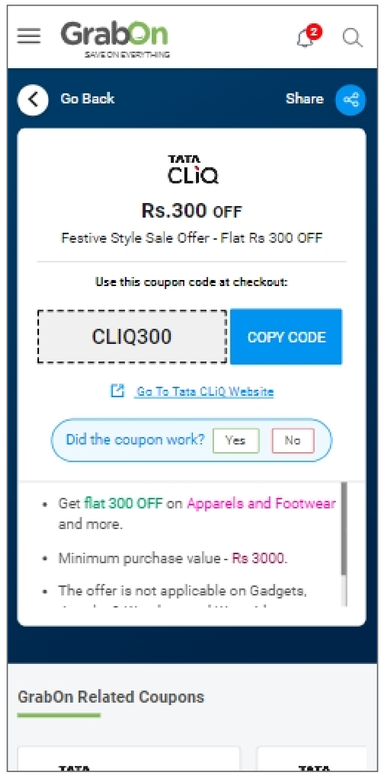

The search box provides suggestions to users while they type a word saving their time.
But, There are lot of tags at the same time. It's overwhelming for user with lot of clutter which looses context.
Filters are missing, What if user just want to see edtech tabs?

Flexibility and efficiency of use

Shortcuts — hidden from novice users — may speed up the interaction for the expert user such that the design can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

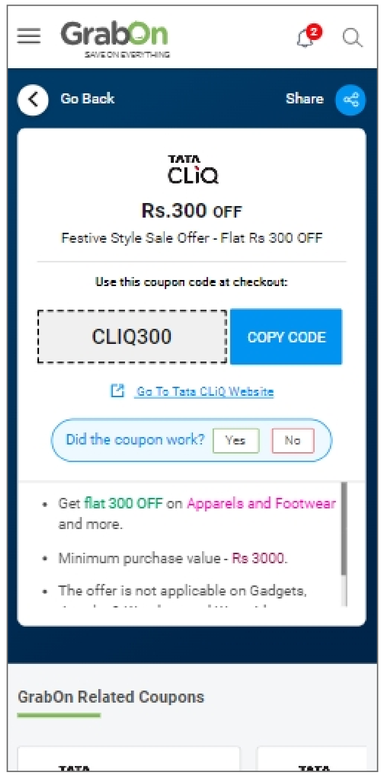

Shortcut - User can also copy code from homepage, there's no need of a separate page for codes.

Bad Average Good

Aesthetic and minimalist design

Interfaces should not contain information that is irrelevant or rarely needed. Every extra unit of information in an interface competes with the relevant units of information and diminishes their relative visibility.

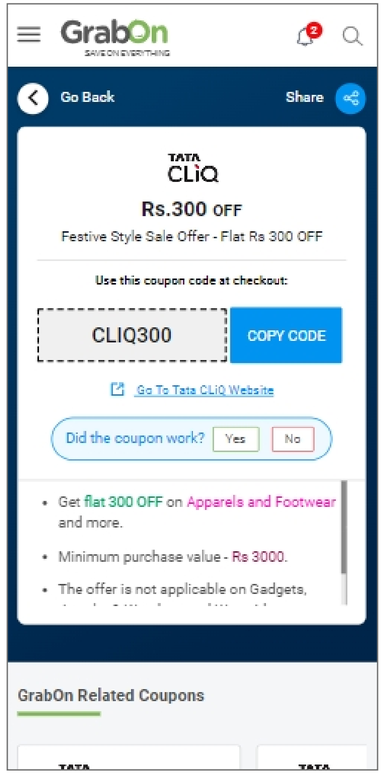

I don't think there's a need of having a back icon with text "back".
Similarly, Share icon is enough for any user to understand the meaning and it should be inside coupon code card.
Mostly users are right handed so if Hamburger menu is placed in right then
It will be easy for right hand thumb to reach menu button compared to
left side placement.
In case coupon code have 10-20+ characters then it'd not be visible cleary as output field is not enough wider because of CTA, So CTA should be below output field.
We can use icons for "yes" or "no" in questionnaire to make it minimal.
There should be a accordion for terms and conditions as current concept is taking too much space for T&C and it looks cluttered.

Bad Average Good

Help users recognize, diagnose, and recover from errors

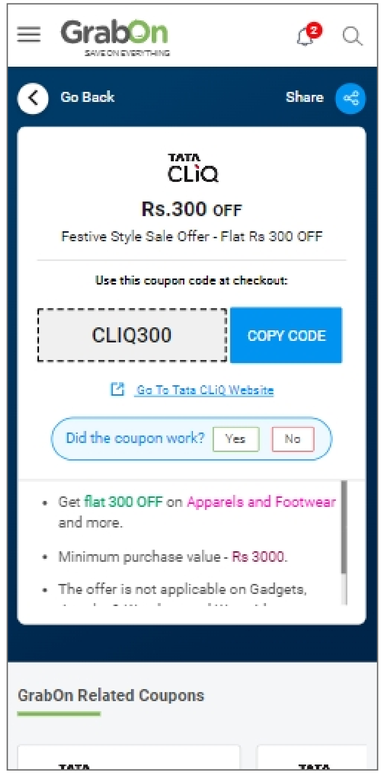

Error messages should be expressed in plain language (no error codes), precisely indicate the problem, and constructively suggest a solution.

Yet to discover, not available for this screen.

Help and documentation

It’s best if the system doesn’t need any additional explanation. However, it may be necessary to provide documentation to help users understand how to complete their tasks.

Not available for this screen.

Solution

I've made changes in the existing design to fulfill Neilsen's heuristic principles.

Tools Used

Overview of improvement

Back icon
(without text)

Discount/Offer in H2
(Offer text needs to be highlighted)

Hamburger menu in right side
(Easily reachable by right hand thumb)

Share icon inside card(User will share coupon so share icon should be inside the card)

Separate section for offer(Information prioritization)

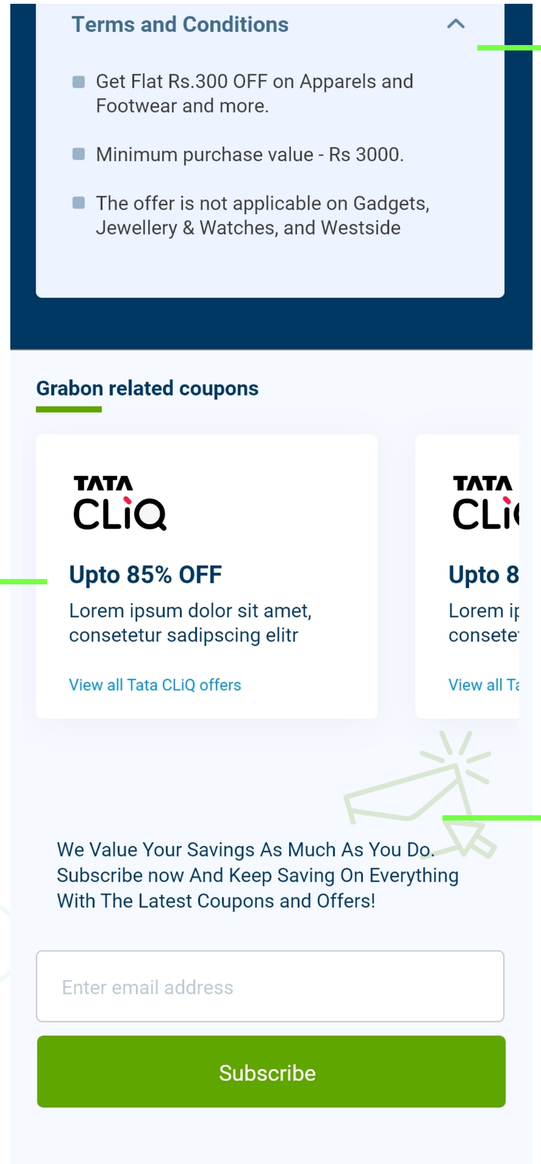

Wider output field(coupon codes with 16+ characters)

CTA (followed by output field)

Questionnaire with Yes or No icons(minimal)

Accordion (to reduce space)

Overview of improvement

Terms and conditions under accordion

Offer/discount in h4 (highlighen text)

Removed text "Subscribe now"(to reduce repetition)

Thank You
